1

Contemporary architectural projects call for innovation and practical solutions that stand up to the rigors of modern living. The Eclisse Automatic Sliding Pocket Door System with integral motor drive is as robust as it is elegant.

The complete
automatic
pocket door
system

2

The simple design of the linear motor drive was developed just for Eclisse. The Plug & Play design means no issues with wiring circuit boards, connect to the power supply and you're off. Good functional design and low installation costs. Use wooden or glass doors with e-motion, any size from 700 to 1400 wide, weighing up to 80 kg.

3

Functional design is central to e-motion thinking. Install with no increase in wall thickness, either 100 or 125mm. The movement is silent, the maintenance is low, it's the bee's knees.

4

Eclisse e-motion goes almost anywhere. En-suite, utility, kitchen, restaurant, hospital, wherever there's a single internal door. Indispensable for the less abled, the Eclisse System works in any environment; residential, commercial, private or public sector. Good design works everywhere and benefits us all.

Plug&play

Just connect the motor to the power supply (AC 230V) and use the integral switch to switch on.

Self setting

The innovative electronic control system installed inside the track starts a self-setting process which senses passage size, weight and friction of the door, in order to set the opening-closing door cycle (speed and acceleration).

Adjustable

Once the self testing is finished, the door opening speed, the opening time, and the sensitivity to obstacles can be adjusted.

The following functions are installed as standard in the system:

Push&Go: through a light manual push on the door handle, the system starts an opening cycle automatically.

Automatic: the door opens by means of an impulse from radar, switch or remote control (supplied separately as an option). Once opened, the door closes automatically.

Open: selecting this mode, the door stays open.

Manual: in case of power failure, [e]motion can be very easily opened manually as there is very little friction from the linear motor system.

[e]Motion fits:

- Single, Luce Single, Unilateral, passage sizes in mm: width 700 x 1300 and Height 1000 x 2600
- Max door weight 80 kg
- Finished wall thickness 100 or 125 mm.

Optional fittings:

- Remote control
- Radar
- Electromechanical lock with remote control

Note: if retro fitted the clearance height is reduced by approximately 25 mm.
